Unique Patented Actuating System

- Our dispensing system is patented
- All components are molded in P/P
- The applicator is provided with a protective cap
- The inside container, which contains your product, is protected by a breakable closing cap. Actuating the inside container, the closing cap is perforated within the outer body
- Our patented perforating system allows for the product to flow onto the filtering mass or sponge

APPLICATIONS:

Ideal for disposable pharmaceutical sterile applications

Cosmetic applications include both gel and liquid products

Our system dispenses your product after the container is filled and placed into the body of the dispenser, and actuated, by pressure. The product then flows into a custom sponge or filter and dispenses onto a surface.

TOPICAL DISPENSER COMPONENTS:

- Inside container closing cap
- Outer body with perforator
- Filtering mass or sponge
- Protective cap for filtering mass and sponge
- Fully made of recyclable PP material

A	Closing cap
B	Filtering mass or sponge
C	Outer body with perforator
D	Outer body with perforator
E	Inside container

Our dispenser has been designed to allow the dispensing of the product WHEN THE CONTAINER IS ACTUATED

**Approved for
medical use**
